ABSTRACT

10 This invention relates a method of treating hyperproliferative diseases. More particularly,
the present invention relates to a method of treating hyperproliferative diseases, such as cancer,
comprising the step of administering to a mammal in need of such treatment, either
15 simultaneously or sequentially, (i) a therapeutically effective amount of a taxane derivative, a
platinum coordination complex selected from the group consisting of carboplatin, tetraplatin, and
topotecan, a nucleoside analog selected from the group consisting of gemcitabine hydrochloride
and 5-FU, an anthracycline, a topoisomerase selected from the group consisting of etoposide,
teniposide, amsacrine, topotecan, and Camptosar[®], an aromatase inhibitor; and (ii) a
20 therapeutically effective amount of an isothiazole derivative. The combinations of the present
invention may optionally include an anti-hypertensive agent. This invention also relates to
pharmaceutical compositions useful in the treatment of hyperproliferative diseases in mammals,
containing such combinations. The present invention also relates to kits having a first
compartment with a compound of formula 1 and a second compartment containing a taxane
derivative, a platinum coordination complex, a nucleoside analog, an anthracycline, a
topoisomerase inhibitor, or an aromatase inhibitor and a third compartment containing an anti-
hypertensive agent.
